

To accommodate performance groups with more than 48 members and as many as 96, two Seating/Evaluation Charts may be attached with tape and then folded one under the other. Such a combined Seating/Evaluation Chart is best used physically apart from the register book by another person, perhaps a mature student assistant. Under those circumstances, you will need to establish a system of signals to indicate to the other person when and how to make marks on the chart. If a regular seating plan has not been established, one should be arranged. Be sure, however, that students are not grouped according to music aptitude levels. High aptitude students should be placed strategically among students with average and low music aptitudes so that they can serve as models to students around them.

Using the Seating/Evaluation Chart

Fill in the information at the top part of the appropriate page of the register book you are using. In the space marked *test*, fill in the acronym (for example, PMMA, IMMA, AMMA, or MAP) for the music aptitude test that was administered to the students. Aptitude testing is described in detail in Part 2 of this handbook.

Look at Illustration 5. It is a reproduction of a partially completed Seating/Evaluation Chart for a first grade general music class of 30 students. At the top of each box is a student's printed name that indicates the place of his or her seat in the classroom. Sufficient space should be left at the bottom of each box for making evaluation marks. Underneath each student's name is his or her percentile rank on the music aptitude test that was administered to the class. For quick and easy identification of students, it may be of assistance to you if lines are drawn above and below some of the names. High scoring students may have a line above their names, low scoring students may have a line below their names, and there may be no lines above or below the names of average scoring students. Or, you may prefer instead to color-code the names. How high, average, or low status is determined from percentile ranks is explained in Part 2 of this handbook. In a typical class of 30 students, it may be anticipated that approximately two-thirds (20) will have average music aptitude, one-sixth (5) will have high music aptitude, and one-sixth (5) will have low music aptitude.

Look at Illustration 6. It is a reproduction of a completed Seating/Evaluation Chart for the same class. The evaluation marks in the boxes consist of single vertical lines and crossed lines. They serve as a record of a student's current achievement on a criterion. A single line indicates that the student has successfully performed a pattern in the teaching mode. Crossed lines indicate that the student has successfully performed a pattern in the evaluation mode. When a student has successfully performed the easy pattern, he or she will have one set of crossed lines in the box. A second set of crossed lines indicates that the student has successfully performed the moderately difficult pattern. A third set of crossed lines indicates that the student has successfully performed the difficult pattern.

Teaching Mode and Evaluation Mode

The majority of criteria in the register books require that each student's performance of the individual patterns be evaluated in the teaching mode and in the evaluation mode. **When in the teaching mode, the teacher performs the individual pattern in duet with the student.** You must listen carefully to the student's performance even though you are singing at the same time. That technique, in addition to teaching the student, builds trust in the teacher by preventing possible embarrassment to a student who may not immediately perform the pattern successfully.

TONAL UNIT 1 SECTION A CRITERION 1

Grade 1 Teacher Ms. Malane Date 9/01 Test PMMA

Sing tonal sequence in D major using "bum."
Sing class patterns in D major using "bum."

Teacher sings pattern using "bum."
Students sing only first pitch using "bum."

Illustration 6

When a student successfully performs the easy pattern in the teaching mode, a single vertical line is made in the appropriate box on the Seating/Evaluation Chart. By marking the box that way, you will know that the next time you gesture to the student he or she should perform the easy pattern solo. When in the evaluation mode, the student performs the pattern alone, without teacher assistance. When a student successfully performs the easy pattern in the evaluation mode, the single line is crossed. By looking at the Seating/Evaluation Chart you will quickly discern that the next time you gesture to the student to perform a pattern, it will be the moderately difficult pattern in the teaching mode. Next the student will perform the moderately difficult pattern in the evaluation mode. At that time there will be two sets of crossed lines in his or her box. The process is repeated for the difficult pattern and then there will be three sets of crossed lines in the box.

When it is time to turn the page in the register book and move on to the next criterion (guidelines for moving ahead are offered in the next section), there may be no lines or from one single vertical line to three crossed lines in each box. Maintaining such records provides for thoughtful and precise instruction, which is not wasteful of time and energy, and takes into account student's individual musical differences. You, the teacher, are able to build on students' accomplishments, challenge them, and continually move them forward in sequential instruction according to their individual musical needs.

The process for completing a criterion on a given page of the register book with an entire class will not, of course, typically be accomplished during one 10 minute session of learning sequence activities. How many sessions it will take depends, among other factors, upon the size of the class, the experience of the teacher, and how often the class meets. Students learn more rapidly when a class is scheduled more than once a week.

After a pattern is successfully performed in the evaluation mode, it becomes a permanent part of the student's audiation vocabulary. That pattern, along with others in the audiation vocabulary, will be used later to teach reading, writing, creativity, improvisation, and so on.

Music Aptitudes and Expectations

When using learning sequence activities, each student is expected to meet his or her potential. A student with low music aptitude is expected to perform the easy pattern in the teaching mode and the evaluation mode. A student with average music aptitude is expected to perform the easy pattern and the moderately difficult pattern in the teaching mode and the evaluation mode. A student with high music aptitude is expected to perform the easy pattern, the moderately difficult pattern, and the difficult pattern in the teaching mode and the evaluation mode. As a result, a student with high music aptitude will learn three patterns, a student with average music aptitude will learn two patterns, and a student with low music aptitude will learn one pattern for a given criterion, the same amount of time being devoted to every student during learning sequence activities.

Ideally, all students, regardless of whether their music aptitude is high, average, or low, learn to perform the easy pattern solo. All students with average and high music aptitudes learn to perform the moderately difficult pattern solo. All students with high music aptitude learn to perform the difficult pattern solo. The easy pattern is taught before the moderately difficult pattern, and the moderately difficult pattern is taught before the difficult pattern. Unless high and average aptitude students learn to perform the easy pattern solo and high aptitude students learn to perform the moderately difficult pattern solo, those patterns will not become part of their audiation vocabularies. Realistically, in order for a pattern to become part of the audiation vocabulary, it must be both heard and performed.

That does not mean, however, that a student with low music aptitude who quickly learns to perform the easy pattern should never be asked to try to perform the moderately difficult pattern, nor that a student

with average music aptitude who quickly learns to perform the moderately difficult pattern should never be asked to try to perform the difficult pattern. Students who fit the description must be given such opportunity without the use of force. In that way, if a student's test score is in error, and that occurs occasionally because no test is perfectly valid, the mistake will immediately come to your attention and a correction in the student's box on the Seating/Evaluation Chart can be made. Moreover, students in the developmental music aptitude stage (explained in Part 2 of this handbook) whose aptitude has changed will immediately be known. Verification of the developmental change can be made when the music aptitude is again administered to the class.

Some teachers are cautious about using a music aptitude test because they are fearful that low scoring students will be ridiculed, punished, and/or labeled as being inferior. Such a misunderstanding and misuse of tests will not occur if the results are used strictly for improving instruction and if they are treated with confidentiality. Remember, when a low scoring student achieves success with the easy pattern, his or her self-concept will be enhanced. If a teacher unwittingly forces that student to attempt to perform solo more difficult patterns, failure and embarrassment will be the outcome. Usually, students with low music aptitude are unaware that others are learning different and more patterns.

Although achievement in the performance of patterns takes precedence over music aptitude scores for students who achieve at a higher level than their music aptitude test results predict, that is not the case for high scoring students who achieve in the performance of patterns at a lower level than their music aptitude test results predict. That is, low scores may be unreliable but high scores are almost never obtained by chance. High scoring students can be expected, regardless of their attitude, to achieve high levels of pattern performance.

Moving Ahead

When at least 4 of every 5 students in a class or performance group (approximately 80 percent of students) achieve their potential on a criterion, you should move ahead to the following criterion on the next page in the register book. Do not be overly concerned about the 20 percent of students who do not reach their potential on a criterion. Most of them usually acquire the readiness informally to achieve the next criterion just by being in the classroom, although their audiation vocabularies will not be as large as they could be. As you move from criterion to criterion, you will discover that the group of students who does not meet their potential on one criterion will not be the same as the group of students who does not meet their potential on another criterion.

The Seating/Evaluation Chart for each new criterion in the register book will, of course, be blank. To save time and avoid tedious work, make a master copy of the Seating/Evaluation Chart that includes only names and percentile ranks, not evaluation marks, for each class. Duplicates may be made on a copy machine and taped over the blank Seating/Evaluation Chart, or you may use the adhesive paper the publisher provides for copying the Seating/Evaluation Charts. Photocopy the master chart on to the adhesive paper, peel off the back, and stick the new chart on the appropriate page of the register book.

You should be discreet when marking the Seating/Evaluation Chart. Evaluation marks should not be made on the chart directly after a student has performed an individual pattern, either in the teaching mode or the evaluation mode. The chart should be marked when all students are performing one or more class patterns. Marks may be made for two or more students at the same time.

Rhythm Patterns

The rhythm register books are organized the same way as are the tonal register books. The instructions and patterns, of course, are different. Look at Illustration 7. It is a reproduction of Rhythm Unit 1, Section A, Criterion 1. The unit number, section letter, and criterion number are indicated at the top of the page.

Also on the page is specific information to the teacher for chanting the rhythm sequence and the class and dialogue patterns. (These terms are explained in Part 3 of this handbook and defined in the Glossary). Next are directions to the teacher for chanting the patterns as well as responses expected of students.

The individual patterns are notated below the information and directions. The meter is indicated in which the rhythm patterns are to be chanted.

Notice that, as with tonal patterns, there are three difficulty levels of individual patterns in the criterion in Illustration 7. However, a difficulty level in rhythm learning sequence activities generally includes two or more rhythm patterns. The combined rhythm patterns in each difficulty level are at least two measures long. The vertical single and double lines are measures lines within a difficulty level. Above the sets of individual patterns are the letters E, M, and D. The letters indicate the difficulty levels of the patterns. E means that the patterns below are easy to audiate, M means that the patterns below are moderately difficult to audiate, and D means that the patterns below are difficult to audiate.

Exceptions

Look at Illustration 8. It is a reproduction of Unit 6, Section A, Criterion 1 in Rhythm Register Book 1. There are two sets of individual patterns separated by a diagonal line. The first set of patterns is in usual duple meter (2/4) and the second is in usual triple meter (6/8). Notice that there is a 1 above the first set and a 2 above the second set. Rhythm patterns within each set are separated by single vertical lines. The double vertical lines signify the end of the criterion. The letters E, M, and D are not found because difficulty levels are not unnecessary for teaching the criteria in that unit.

Look at Illustration 9. It is a reproduction of Unit 19, Section A, Criterion 1 in Rhythm Register Book 1. Again, there are no difficulty levels for the unit because there is only one criterion and it is four measures long.

Using the Seating/Evaluation Chart

Although students will be occupying the same seats whether tonal learning sequence activities or rhythm learning sequence activities are being taught, two seating charts must be made: One is for using the tonal register book and the other is for using the rhythm register book. The reason is because the students' music aptitude rankings on each chart will be different. That is, it is rare for all high and low scoring students to receive the same percentile rank on a tonal aptitude test and a rhythm aptitude test. If a student scores high on one test, he or she will probably score average or low on the other. If a student scores low on one test, he or she will probably score average or high on the other. It is not unusual, however, for students to score average on both tests.

The Seating/Evaluation Chart is marked the same way when teaching rhythm patterns in rhythm learning sequence activities as it is when teaching tonal patterns in tonal learning sequence activities. How to use the Seating/Evaluation Chart for giving marks in the teaching mode and the evaluation mode is explained in the previous section for tonal patterns.
